YOU

You said i deleted help me still recommit properly est/usr/local/share/bettercap/caplets/hstshijack/hstshijac…

GEMINI

You hit GitHub's 100 MB file size limit because Linux Administration with sed and awk.zip is 377 MB, and it is still sitting inside your Git history, even though you deleted the file and ran git reset HEAD~1.
Because the large file exists in a previous commit, pushing the branch still triggers GitHub's pre-receive hook rejection. To fix this properly, you need to unstage/remove the large file from your commit history entirely, add it to .gitignore (or use Git LFS), and force push the cleaned history.
Here are the step-by-step commands to resolve this:
Step 1: Undo your last local commit
Bring your files back to the staging area so you can properly exclude the large zip file:
Bash
git reset --soft HEAD~1
Step 2: Remove the large file from Git tracking (and keep it locally)
If you don't want the 377 MB zip file tracked by Git at all, remove it from the index and add it to your .gitignore:
Bash
git rm --cached "Linux Administration with sed and awk.zip"
echo "Linux Administration with sed and awk.zip" >> .gitignore
Step 3: Completely purge the file from past Git history
GitHub looks at your entire commit tree. To remove the file from all previous commits where it might have been saved, use git filter-branch or git filter-repo (or simply reset back past where it was introduced if this is a fresh repo). Assuming you want to scrub it from the immediate history:
Bash
git add .gitignore
git commit -m "Remove large zip file and update .gitignore"
If the file was committed in an earlier commit prior to your last reset, you can use git filter-branch to purge it completely:
Bash
git filter-branch --force --index-filter \
"git rm --cached --ignore-unmatch 'Linux Administration with sed and awk.zip'" \
--prune-empty --tag-name-filter cat -- --all
Step 4: Force push to GitHub
Once the history is clean and the file is no longer tracked, push your changes:
Bash
git push -u origin main --force
Alternative Option: If you must keep Linux Administration with sed and awk.zip in your GitHub repository, you will need to install and configure Git Large File Storage (LFS) before committing it:
Bash
git lfs install
git lfs track "*.zip"
git add .gitattributes
git add "Linux Administration with sed and awk.zip"
git commit -m "Add large zip via Git LFS"
git push -u origin main
